

REAL TIME COMMUNICATION SYSTEM FOR SPECIALLY ABLED USING AI

1.INTRODUCTION

1.1 Project Overview

Communication is a social process of exchanging information from one entity to another in verbal and non-verbal form. It defines our existence and it is an important instrument that connects people together. It comes naturally as a raw skill embedded in most people at birth and we acquired the ways of communication through cognitive learning. Communication is the basis, which drives the process of development in all the fields and it is the very core of our civilization. The ability to communicate allows us to express emotion, feelings, convey our thoughts and ideas as well as to relate our experiences. It plays an important role in the dissemination of information and sharing of knowledge especially in the academic arena. Research has found that humans started to learn how to communicate with each other since they are born not only through spoken and written languages but also body gesture, posture, facial expression and eye contacts. Communication skill might come as a natural ability in the majority of people.

1.2 Purpose

Many assistive tools or formally termed as Alternative and Augmentative Communication has been developed and employed to assist people with impaired communication skills. The term encompasses the whole combination of methods used for communication such as text to speech system, pointing gestures, facial expression and body language. Although these AACs have been widely used to assist the disabled, it is not potentially effective because most AACs are text to speech and touch screen based applications, which are unsuitable for those with severe physical abilities.

2 LITERATURE SURVEY

2.1 Existing problem

There are some people afflicted with some form of physical defects which affect their ability to communicate. One of the more severe disabilities is known as “cerebral palsy”, a congenital disorder at birth which causes abnormality in their motor system. It affects their muscle movement and coordination, learning and speech abilities. Their malfunctioned motor system causes an uncontrollable and involuntary movement. They are unable to control their oral-facial muscles, thus affecting their ability to perform facial expression appropriately.

It's been over a decade since facial recognition technology has been a significant topic in the news. It made headlines in 2005 when it was used to identify the 9/11 terrorists. Ten years later, it seems that this high-tech innovation is being used less for catching criminals and more for making people feel secure.

2.3Problem Statement Definition

In our society, we have people with disabilities. The technology is developing day by day but no significant developments are undertaken for the betterment of these people. Communication between deaf-mute and a normal person has always been a challenging task. It is very difficult for mute people to convey their message to normal people. Since normal people are not trained in hand sign language. In emergency times conveying their message is very difficult. The human hand has remained a popular choice to convey information in situations where other forms like speech cannot be used. Voice Conversion System with Hand Gesture Recognition and translation will be very useful to have a proper conversation between a normal person and an impaired person in any language. The project aims to develop a system that converts the sign language into a human hearing voice in the desired language to convey a message to normal people, as well as convert speech into understandable sign language for the deaf and dumb. We are making use of a convolution neural network to create a model that is trained on different hand gestures. An app is built which uses this model. This app enables deaf and dumb people to convey their information using signs which get converted to human understandable language and speech is given as output.

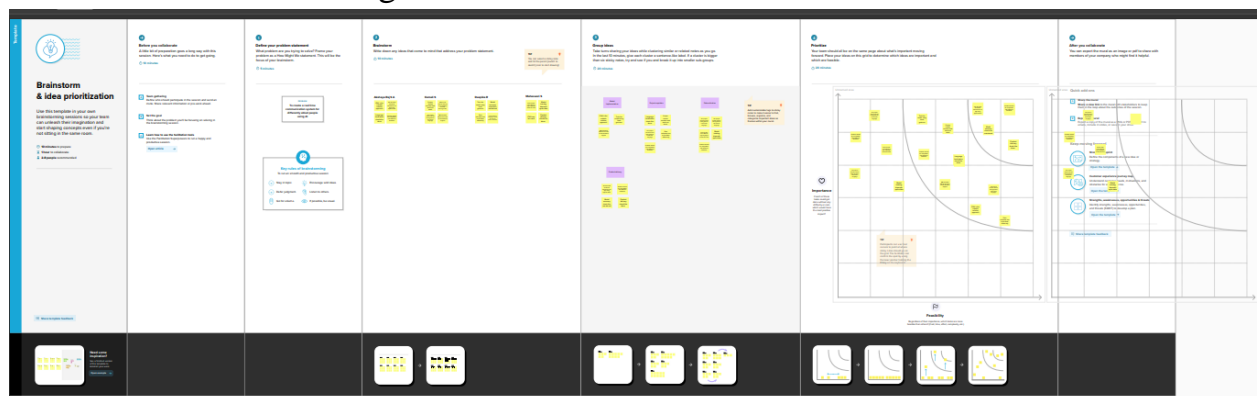

3 IDEATION & PROPOSED SOLUTION

3.1 Empathy Map Canvas

Empathy map was done by our team using the ideas of how, why and what users think or say about their feelings over this project.

3.2 Ideation & Brainstorming

3.3 Proposed Solution

- We are making use of a convolution neural network to create a model that is trained on different hand gestures. An app is built which uses this model.
- This app enables deaf and dumb people to convey their information using signs which get converted to human-understandable language and speech is given as output.
- The technology is developing day by day but no significant developments are undertaken for the betterment of these people. Communication between deaf-mute and a normal person has always been a challenging task.

Problem Solution fit

<p>Define CS, fit int 2 CC</p> <p>Focus on J & P, tap into BE, understand</p>	<p>1. CUSTOMER SEGMENT(S) CS</p> <p>Who is your customer? <small>CC</small> working parents of 0-5 <small>CC</small> kids</p> <p>A person, who is deaf-mute and a person who is trying to communication with them is our customer.</p>	<p>6. CUSTOMER CONSTRAINTS CC</p> <p>What constraints prevent your customers from taking action or limit their choices? <small>CC</small> solutions? <small>CC</small> spending power, budget, no cash, network connection, available devices.</p> <ul style="list-style-type: none"> ➤ The application is cost efficient. ➤ Lack of Network Connection. ➤ Eliminates the usage of expensive technology. 	<p>5. AVAILABLE SOLUTIONS AS</p> <p>Which solutions are available to the customers when they face the <small>CC</small>?</p> <p><small>CC</small> need to get the job done? What have they tried in the past? What pros & cons do these solutions have? <small>CC</small> pen and paper is an alternative to digital <small>CC</small>.</p> <ul style="list-style-type: none"> ➤ The solutions aims to provide that person can easily communicate with each others. ➤ The user-friendly <small>CC</small> of the system ensure that people can use it without any difficulty. 	<p>Explore AS, differentiate</p>
	<p>2. JOBS-TO-BE-DONE / PROBLEMS J&P</p> <p>Which jobs-to-be-done (or problems) do you address for your customer? There could be more than one; explore different sides.</p> <ul style="list-style-type: none"> ➤ Person can able to convey their information with other by using this application. ➤ Mute people can able to communicate with normal people, here gestures were converted into voice. 	<p>9. PROBLEM ROOT CAUSE RC</p> <p>What is the real reason that this problem exists? What is the back story behind the need to do this job? <small>CC</small> consumers have to do it because of the change in requirements.</p> <p>The root cause is manually keep tracking of gestures is really hard and not easy to understand by all peoples.</p>	<p>7. BEHAVIOUR BE</p> <p>What does your customer do to address the problem and get the job done?</p> <p><small>CC</small> directly related: <small>CC</small> the right solar panel installer, calculate usage and <small>CC</small>. indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace)</p> <ul style="list-style-type: none"> ➤ As an easy and practical way to achieve human-computer-interaction. ➤ Gesture to speech and text-conversion has been used to reduce the hardware components. 	<p>Focus on J & P, tap into BE, understand</p>
<p>Identify system</p>	<p>3. TRIGGERS TR</p> <p>What triggers customers to act? <small>CC</small> seeing their <small>CC</small> installing solar panels, reading about a more <small>CC</small> solution in the news.</p> <p>By seeing others installing the application to communicate with specially-abled person increases the product needs.</p>	<p>10. YOUR SOLUTION SL</p> <p>If you are working on an existing business, write down your current solution <small>CC</small> <small>CC</small> in the canvas, and check how much it <small>CC</small> reality. If you are working on a new business proposition, then keep it blank until you <small>CC</small> in the canvas and come up with a solution that <small>CC</small> within customer limitations, solves a problem and matches customer <small>CC</small>.</p> <ul style="list-style-type: none"> ➤ The application can be integrated with other mobile devices to improve user interaction and make the system more robust. 	<p>8. CHANNELS of BEHAVIOUR CH</p> <p>8.1 ONLINE What kind of actions do customers take online? Extract online channels from <small>CC</small>.</p> <p>Finding the outline of the image using online.</p> <p>8.2 OFFLINE What kind of actions do customers take <small>CC</small>? Extract <small>CC</small> channels from #7 and use them for customer development.</p> <p>They have to provide a gesture in their hands.</p>	<p>Extract online & offline CH of BE</p>
	<p>4. EMOTIONS: BEFORE / AFTER EM</p> <p>How do customers feel when they face a problem or a job and afterwards? <small>CC</small> lost, insecure > <small>CC</small> in control - use it in your communication strategy & design.</p> <p>Loss their confident, Frustrated, confused and depressed</p>			

4 REQUIREMENT ANALYSIS

4.1 Functional requirement

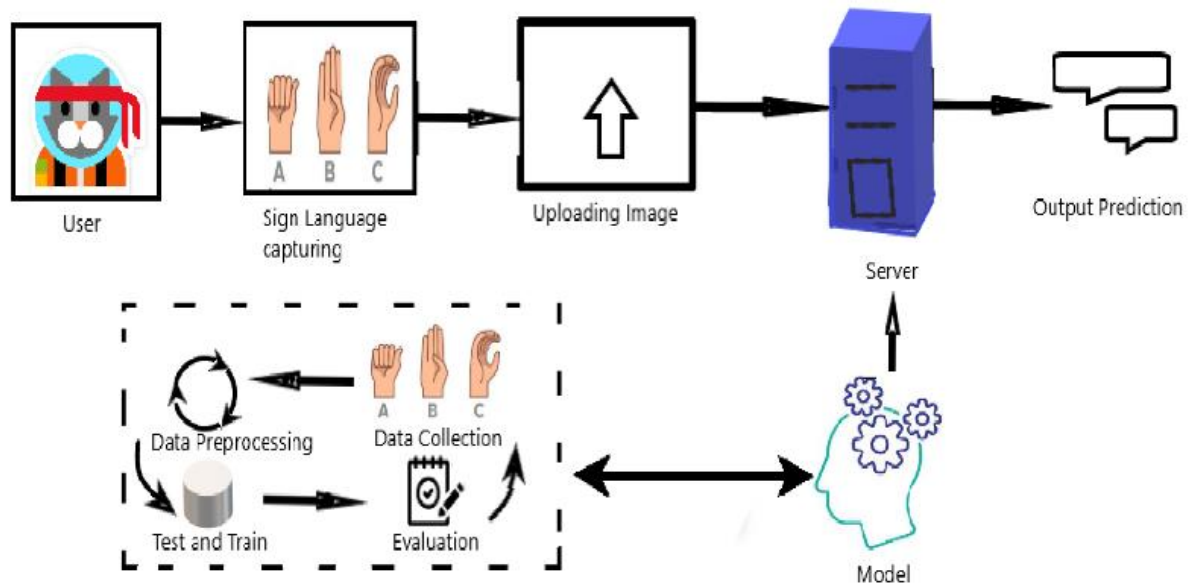

Our functional requirements are categorized as User Registration, User confirmation, Authentication, External interfaces, Transaction, Processing, Reporting and Business rules.

4.2 Non-Functional requirements

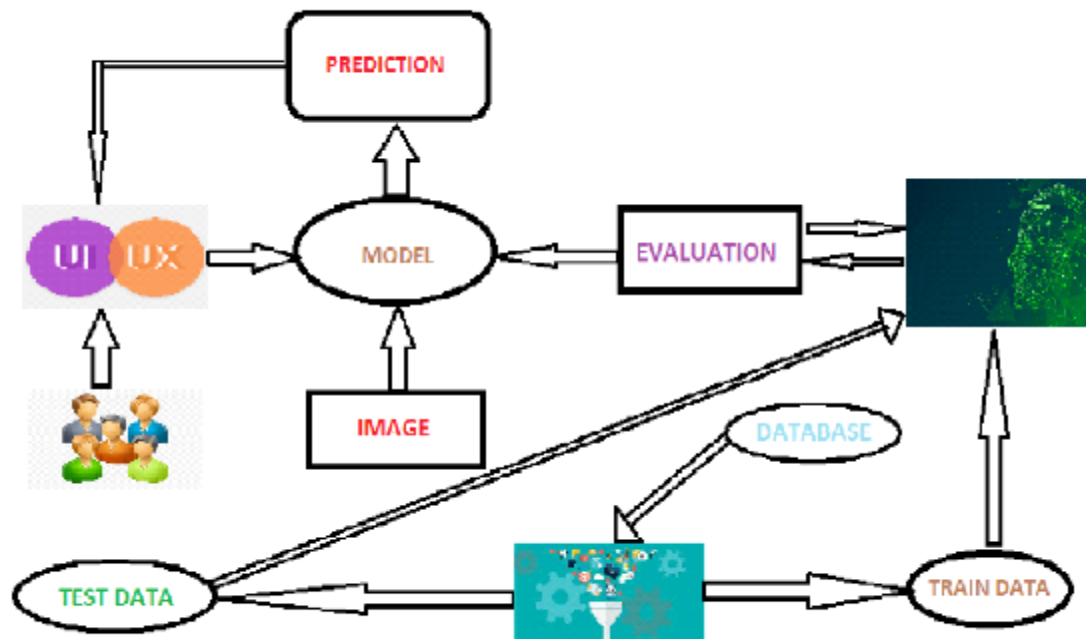

Our non-functional requirements are categorized into Usability, Security, Reliability, Performance, Availability and Scalability.

5 PROJECT DESIGN

5.1 Data Flow Diagrams

5.2 Solution & Technical Architecture

5.3 User Stories

- User can register for the application by entering their email, password, and confirming their password.
- User can register for the application through Google.
- User can receive confirmation content through email.
- User can log into the application by entering email & password.
- User can register by giving in their email, password and confirmation of password.
- User can log into the application by entering email & password.

6 PROJECT PLANNING & SCHEDULING

6.1 Sprint Planning & Estimation

Project Tracker, Velocity & Burn down Chart: |

Sprint	Total StoryPoints	Duration	Sprint Start Date	Sprint End Date(Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date(Actual)
Sprint-1	20	6Days	24Oct 2022	28Oct 2022	20	28Oct 2022
Sprint-2	15	6 Days	31Oct 2022	05Nov 2022	20	05Nov 2022
Sprint-3	20	7 Days	07Nov 2022	13Nov 2022	20	13Nov 2022
Sprint-4	20	6Days	14Nov 2022	19Nov 2022	20	19Nov 2022

6.2 Sprint Delivery Schedule

Burn-downChart:

7 CODING & SOLUTIONING (Explain the features added in the project along with code)

7.1 Feature 1

Real time video input using opencv

With OpenCV, we are capturing a video from the camera. It lets us create a video capture object which is helpful to capture videos through webcam and then we may perform desired operations on that video.

Camera.py

```
import cv2
import numpy as np
from keras.models import load_model
from keras.utils import load_img, img_to_array

class Video(object):
    def __init__(self):
        self.video = cv2.VideoCapture(0)
        self.roi_start = (50, 150)
        self.roi_end = (250, 350)
        self.model = load_model('aslpng1.h5') # Execute Local Trained Model
        # self.model = load_model('IBM_Communication_Model.h5') # Execute IBM Trained Model
```

```

        self.index=['A','B','C','D','E','F','G','H','I']
        self.y = None
    def __del__(self):
        self.video.release()
    def get_frame(self):
        ret,frame = self.video.read()
        frame = cv2.resize(frame, (640, 480))
        copy = frame.copy()
        copy = copy[150:150+200,50:50+200]
        # Prediction Start
        cv2.imwrite('image.jpg',copy)
        copy_img = load_img('image.jpg', target_size=(64,64))
        x = img_to_array(copy_img)
        x = np.expand_dims(x, axis=0)
        pred = np.argmax(self.model.predict(x), axis=1)
        self.y = pred[0]
        cv2.putText(frame,'The          Predicted          Alphabet          is:
'+str(self.index[self.y]),(100,50),cv2.FONT_HERSHEY_SIMPLEX,1,(0,0,0),3)
        ret,jpg = cv2.imencode('.jpg', frame)
        return jpg.tobytes()

```

7.2 Feature 2

Hand Region Segmentation & Hand Detection and Tracking:

The captured images are scanned for hand gestures. This is a part of preprocessing before the image is fed to the model to obtain the prediction. The segments containing gestures are made more pronounced. This increases the chances of prediction by many folds.

The model accumulates the recognized gesture to words. The recognized words are converted into the corresponding speech. The text to speech result is a simple work around but is an invaluable feature as it gives a feel of an actual verbal conversation.

```

import
cv2
    video = cv2.VideoCapture(0)
    while True:
        ret, frame = video.read()
        cv2.imshow("Frame", frame)
        k = cv2.waitKey(1)
        if k == ord('q'):
            break
    video.release()
    cv2.destroyAllWindows()

```

8 TESTING

8.1 Test Cases

We had manually done testing of data from the datasets that are present under the folders from A to I. The accuracy and speed of model are found by performing model tests. Here we had defined the set of test data, preconditions, expected results and post conditions, developed for a particular test scenario .

8.2 User Acceptance Testing

Figure orientation

9 RESULTS

9.1 Performance Metrics

```
10 from skimage.transform import resize
11 def detect(frame):
12     img = resize(frame, (64, 64, 1))
13     img = np.expand_dims(img, axis=0)
14     if(np.max(img)>1):
15         img = img/255.0
16     prediction = model.predict(img)
17     print(prediction)
18     prediction = np.argmax(prediction, axis=1)
19     print(prediction)
```

20 ADVANTAGES & DISADVANTAGES

Advantages

This app enables deaf and dumb people to convey their information using signs which get converted to human understandable language and speech is given as output.

This model builds a communication system that enables communications between deaf-dumb person and a normal person.

21 DISADVANTAGES

A disadvantage of this model is that it can only predict the letters as of now .The future scope of this model will be to predict and display words as well as sentences through gestures as this model is trained based on predicting only the letter for now.

22 CONCLUSION

The proposed communication system between Deaf and Dumb people and ordinary people are aiming for it when bridging the communication gap between two societies. Several works were done earlier in this area, but this paper adds in complete two - sided communication in an efficient manner because the system is implemented as an easily available application. So, it really serves its needs in all aspects. The above strategies prove to be efficient In terms of time and accuracy.

23 FUTURE SCOPE

The future scope of this model is be to predict and display words as well as sentences through gestures provided by differently abled people. This may enable the communication much easier than how this model could do.

24 APPENDIX

Source Code

APP.py

```
from flask import Flask, Response, render_template
```

```
from camera import Video
```

```
app = Flask(__name__)
```

```
@app.route('/')
```

```
def index():
```

```
    return render_template('index.html')
```

```
def gen(camera):
```

```
    while True:
```

```
        frame = camera.get_frame()
```

```
        yield(b'--frame\r\n'
```

```
              b'Content-Type: image/jpeg\r\n\r\n' + frame +
```

```
              b'\r\n\r\n')
```

```
@app.route('/video_feed')
```

```
def video_feed():
```

```
    video = Video()
```

```
    return Response(gen(video), mimetype='multipart/x-mixed-replace; boundary = frame')
```

```
if __name__ == '__main__':
```

```
    app.run()
```

main.py

```
import cv2

video = cv2.VideoCapture(0)

while True:
    ret, frame = video.read()
    cv2.imshow("Frame", frame)
    k = cv2.waitKey(1)
    if k == ord('q'):
        break

video.release()
cv2.destroyAllWindows()
```
